

Trance Audio Custom Shop Phantom Power Box

This is a refurbished Rolls or Sterling 48volt phantom power supply that has some added features to allow you to utilize the stereo outputs available on some of our Amulet Ultra preamp models. As these are refurbished units, there may be some cosmetic imperfections (scratches and dings), but they are rebuilt to our stringent specifications and will function perfectly for many years to come.

Our Custom Shop Phantom power box requires a common 9vdc adapter (not provided) to function.

The specifications for the adapter are:

- 9vdc output, 200ma (or higher; a higher ma capability is fine, it just means that the adapter will be physically larger)
- center negative 2.1mm connector

There will usually be a description on the adapter that specifies the output voltage (in this case, 9vdc), and a symbol showing the polarity at the output jack (notice the "-" symbol pointing to the center dot, and the "+" symbol pointing to the outer ring of the connector symbol).

The Phantom Power Box can also be easily powered from most common pedalboard power supplies; the 9vdc center negative supply is the accepted universal standard for most guitar pedals.

Features of the Custom Shop Phantom Power Box:

- We've added a pair of standard 1/4" TS output jacks on the back of the unit, labeled LEFT and RIGHT.
- The LEFT jack is connected internally to the XLR OUT connector Pin 2, and represents the MONO output of the Amulet Ultra Dual Mono and Multi Mono preamp models, and the LEFT output of the Amulet Ultra True Stereo and Multi Stereo preamp models.
- The RIGHT jack is connected internally to the XLR OUT connector Pin 3, and represents the RIGHT output of the Amulet Ultra True Stereo and Multi Stereo preamp models. It is also used for the FX and CV preamp models.

If you need additional outputs, you can also add one of our special Y-Cable adapters to the XLR output connector on the back, to provide an additional pair of XLR Male or 1/4" TS plugs for connections to external gear.
